This section of the competition consists of eight problems, which will be presented in pairs. Work on one pair of problems will be completed and answers will be collected before the next pair is distributed. The time limit for each pair of problems is six minutes. The first pair of problems is on the other side of this sheet. When told to do so, turn the page over and begin working. This round assumes the use of calculators, and calculations also may be done on scratch paper, but no other aids are allowed. All answers must be complete, legible and simplified to lowest terms. Record only final answers in the blanks in the left-hand column of the problem sheets. If you complete the problems before time is called, use the time remaining to check your answers.
1. _______ dimes   Kelly has $12.00 in dimes and quarters. She has six more quarters than dimes. How many dimes does Kelly have?

2. _______ day   The height of a bean plant is measured daily. At the end of the second day of observations, it measured 1 inch in height. Thereafter, its height doubled every two days. At the end of which day will the plant measure exactly 16 inches tall?
3. ______ students  Koda teaches a total of 25 students in three different swimming classes. He teaches his first two classes on Friday and his third class on Saturday. There are seven students in Koda’s Saturday class. What is the average number of students in Koda’s Friday classes?

4. ________  What is the least positive integer $n$ such that the product of 2016 and $n$ ends in the digits 00?
